

OCEAN EMPIRE DIAGNOSTIC

PATIENT: John Doe

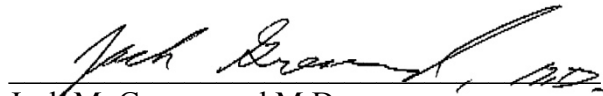

Date of Birth: 3-18-90

Date of Study: 7-5-2011

Referred by: Dr. Spadafora

Electrodiagnostic testing was done on the upper and lower extremities. On motor testing, all values are normal. No definite right tibial H-reflex was elicited with stimulation. On sensory testing, no response was elicited with stimulation of the right ulnar, right sural, and left sural nerves. Left ulnar sensory nerve action potential amplitude was decreased.

IMPRESSION: In the appropriate setting, these findings are consistent with a right-sided lumbosacral radiculopathy and a sensory neuropathy. Suggest clinical correlation.
